Problem & Solution Overview

Problem Overview

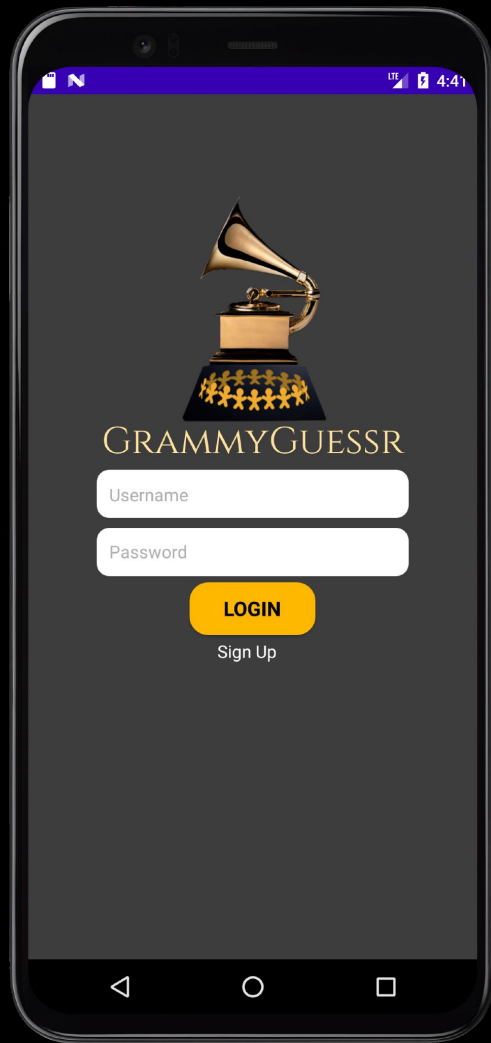

In the past, many people watched the GRAMMY awards as a social activity to bond with their friends and families. However, the **viewership of the Grammy awards has decreased** over the years, especially since fewer people nowadays watch live TV, most notably the younger generation. One way that these award shows are trying to improve viewership, especially amongst younger audiences, is by publishing their results on social media. However, this leads people to simply follow the results of award shows without watching the actual procession, so they only rely on social media and news outlets that cover the results. This way of viewing the GRAMMYs **prevents the social interaction and discussion that previously surrounded the award show.**

Solution Overview

Our proposed solution is to **make predicting the winners of the GRAMMYS a social and community-driven activity**, allowing users to share and discuss their predictions with both their close circles and strangers, which will hopefully increase engagement both with the award show and within a community of avid music fans.

Prototype Screens

1 Login Screen

We first drew our **login screen** to get our creative juices flowing, but we ended up finding it important to emphasize that our app is more focused on the **individualization of each user and the social aspect**, rather than having it be a kind of game. This design stayed the same in our Interactive Prototype.

Prototype Screens

2 Feed Page Screen

We deemed the **feed page** as the most important part of our app because it showcases the social and community-driven of enjoying the GRAMMYS. The **world feed** and **friend feed** would look almost exactly the same (except for the + buttons on the world feed signifying add friend). We've also added room for plenty of interaction with the **upvoting, downvoting, and commenting features**. We took inspiration from Twitter for the feed style, Reddit for the upvoting and downvoting features, and Tiktok for the add friend feature.

This design mostly stayed the same in our Interactive Prototype, with some changes based on user feedback.

Friend Feed

Paper Prototype

Prototype Screens

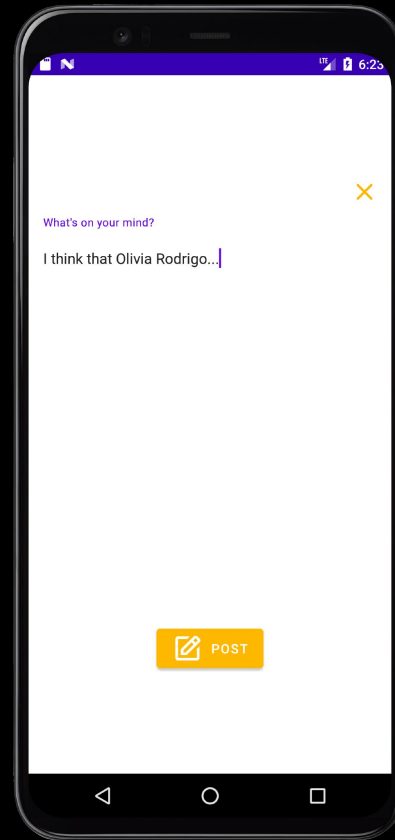

3 'New Text Post' Screen

We also implemented a **pop up window for writing a text post**, which was inspired by Twitter and Facebook. The user can input anything that's on their mind related to the GRAMMYS.

This design mostly stayed the same in our Interactive Prototype, but we essentially made the pop up an entirely new page.

4

Detailed Post Screen

Next, we worked on **what a post would look like** when you clicked to enlarge a post on the feed. We looked to Twitter for the **layout of the comments, upvotes/downvotes, date and time posted, and profile name**. We decided to include an **"Add Friend" button** on this page for a quicker shortcut for users to expand their social network on our app. This was to encourage more discussion and interaction through the app. This design mostly stayed the same in our Interactive Prototype, with slight changes based on user feedback.

Prototype Screens

5

Predictions Page Screen

Next, we implemented the next most important page, where users would add their predictions. We wanted to make it less overwhelming for the user, so we included the option to only view and vote on the most popular categories, along with the option to view all award categories. We also decided to include a feature that tells the user what percentage of users also predicted their chosen prediction as a way to spark discussion. In this screen, we included all three possible vote views. The top category is displayed once the user has already voted, the second is where the user hasn't voted for yet, and the third is during the actual voting process. This design mostly stayed the same in our Interactive Prototype, with some changes based on user feedback.

5 Predictions Page Screen: Major Changes

The biggest change we made was in our predictions page. We made a new sketch to reflect this change. Once the user has saved their vote, they have the option to change their vote. The user can view the voting breakdown result in a pie chart form by pressing the “View Voting Breakdown” button.

6 Profile Page Screen

We also wanted to show what a **user's profile would look like**, so we drew that next. We based our profile layout on Instagram and Facebook, with one view showing **all the user's posts and the other showing all the user's friends**. The layout of the actual posts was inspired by Twitter. This design mostly stayed the same in our Interactive Prototype, with slight changes based on user feedback.

7 Search Page Screen

User input
text box
for search

Paper Prototype

Lastly, we worked on the **search page** and the **notifications page** so that we could have a sketch of every page that we included on our menu bar at the bottom. We based the search page off of Instagram, allowing the user to **filter their search by people or posts**. These designs stayed the same in our Interactive Prototype.

interaction

Paper Prototype

Lastly, we worked on the **search page** and the **notifications page** so that we could have a sketch of every page that we included on our menu bar at the bottom. We also took inspiration from Instagram for the notifications page, which allows you to **click on the notification to take you to the post it refers to**.

These designs stayed the same in our Interactive Prototype.

02

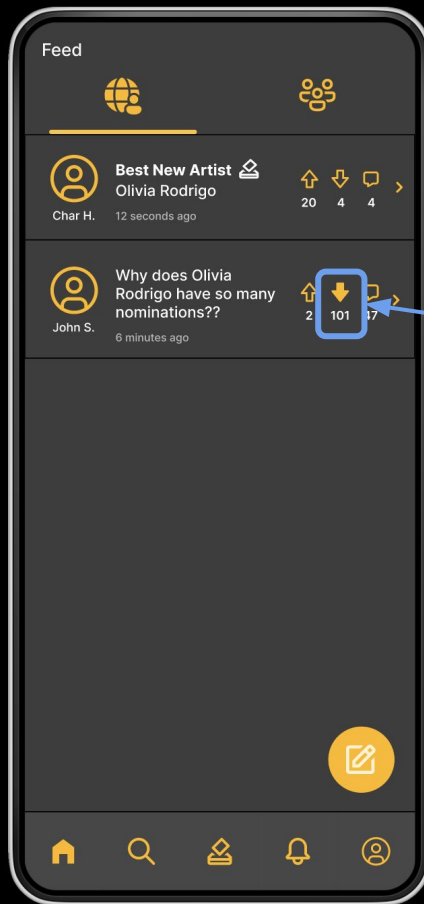

User Tasks

Primary Task 1: Interacting With Feed

1. After logging in, the user can interact with the Feed Page by downvoting or upvoting John S.'s and/or Char H.'s post..

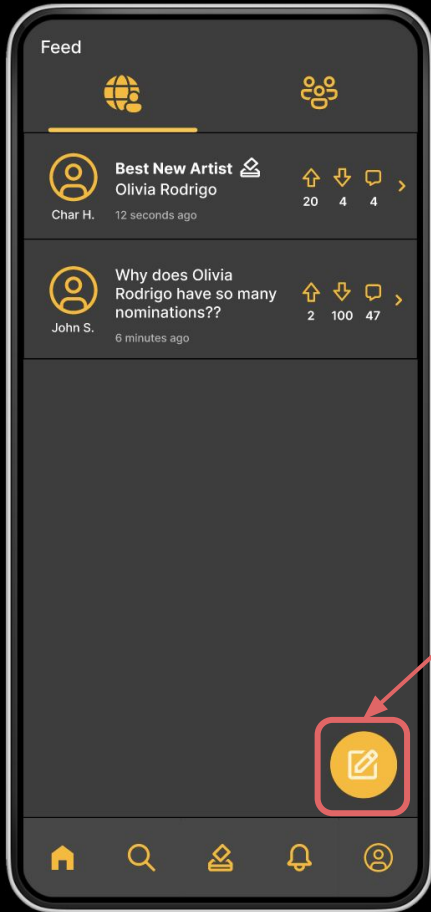

Difficulty Level:
Easy

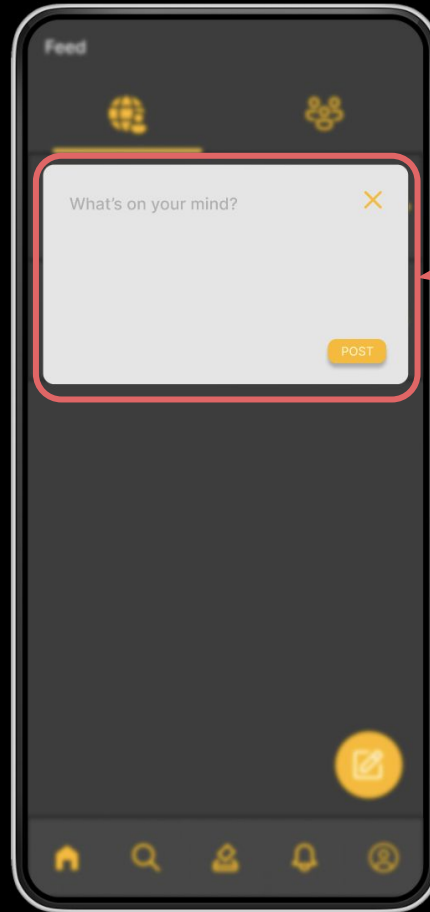

2. After the user presses the downvote arrow, the downvoted post shows a filled in down-arrow.

This page included **one of our primary tasks**, which involved having the user downvote John S's post to demonstrate interacting with posts. We chose this as a primary task to emphasize user interaction, which was the main focus of our app.

Primary Task 2: Making a Post

1. From the Feed Page, the user can click on the writing icon to make a new text post

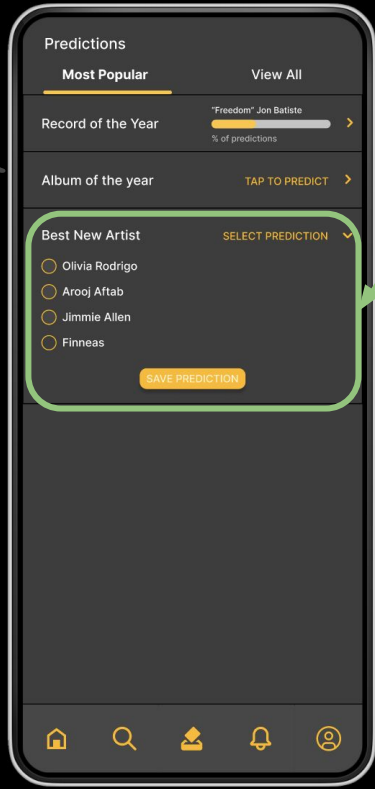

Difficulty Level:
Medium

2. After clicking A pop-up textbox will appear where the user can post what is on their minds

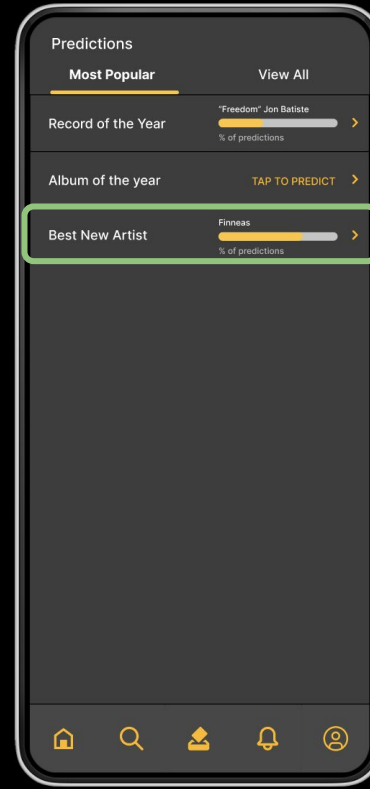

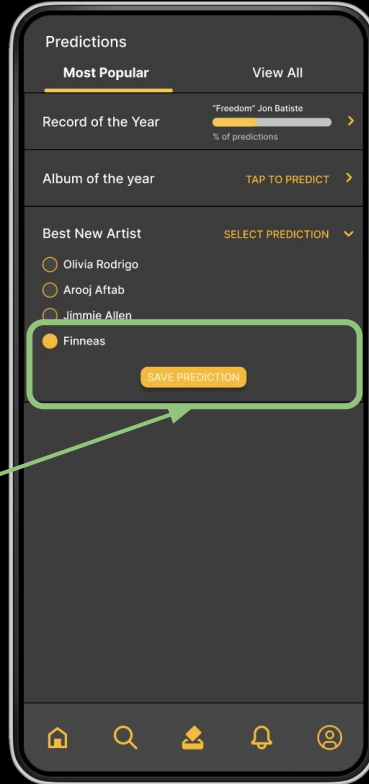

This screen included **another primary task: having the user create a post for their feed**. We chose this as a primary task because we believe starting discussions to be an important factor of our app's emphasis of socialization.

Primary Task 3: Voting & Saving a Prediction

1. In the Predictions Page, the user clicks on a category, and a drop-down menu lists all the possible nominations the user can vote for

2. The user picks from the list and saves their prediction

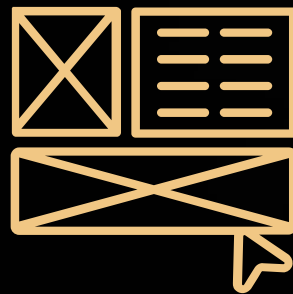

Difficulty Level: Hard

3. After clicking the 'Save Prediction' button, the percentage of users who agree with user's prediction is shown

Our final primary task was to have the user vote for Finneas and save their prediction. We included this as a primary task because thought the voting process was very important to our app, as it is the main root of discussion.

03

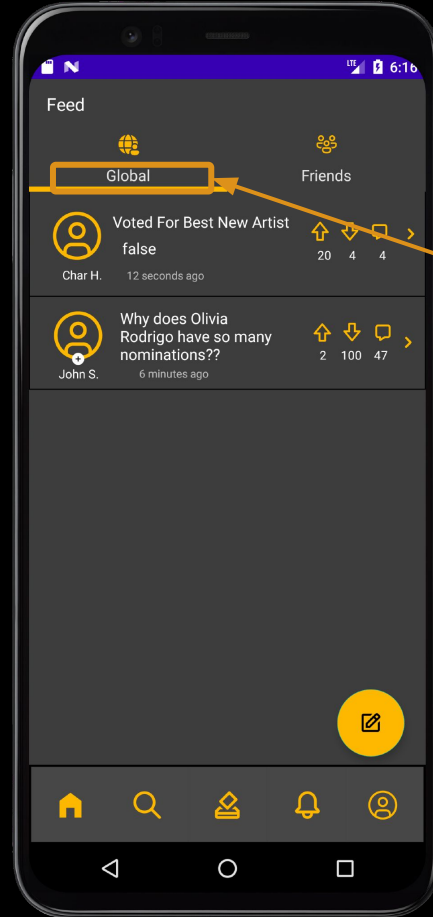

Revised Interface Design

Changes to Home Feed

User Issue:
M.B. had difficulty understanding what the icon of the "Global" feed tab represented.

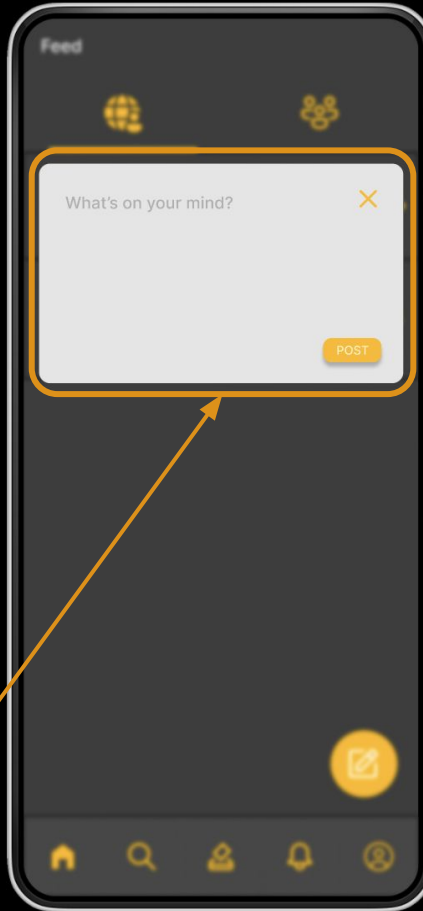

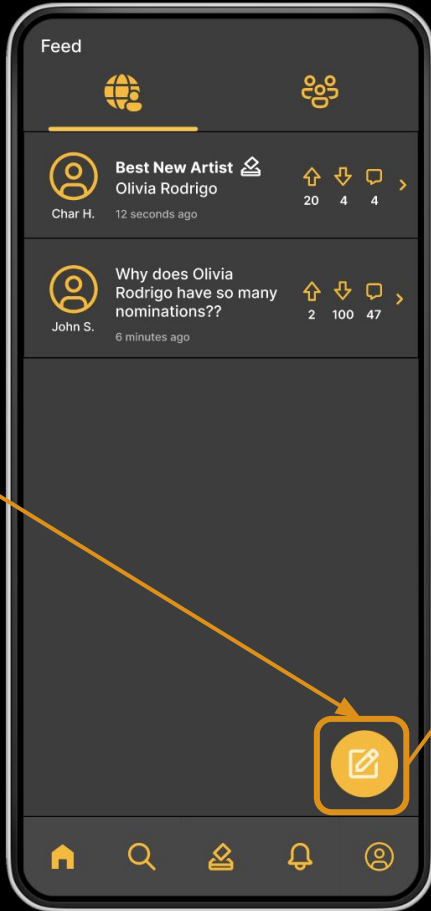

Change:
We added text under the tabs to make it explicit.

Changes to Making a Post

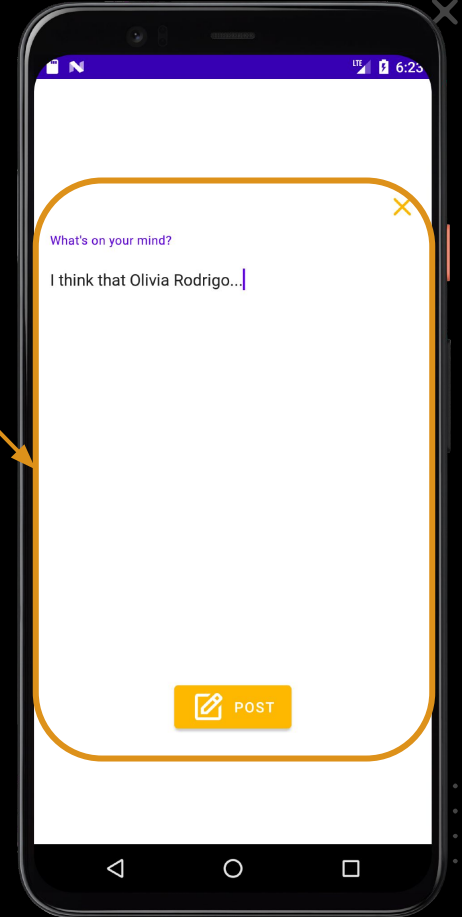

User Issue:

L.C. expected the “Make a Post” Icon to take her to a new page, instead of opening up a pop-up.

Change:

We removed the pop up, and created a new screen.

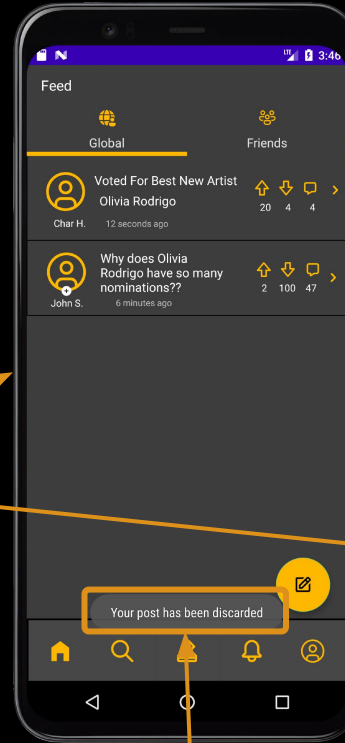

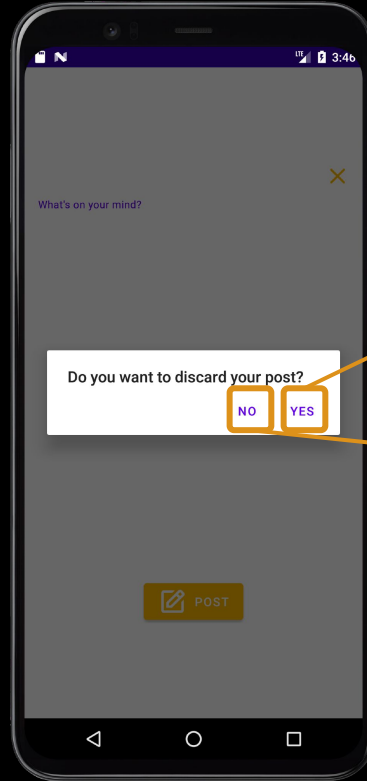

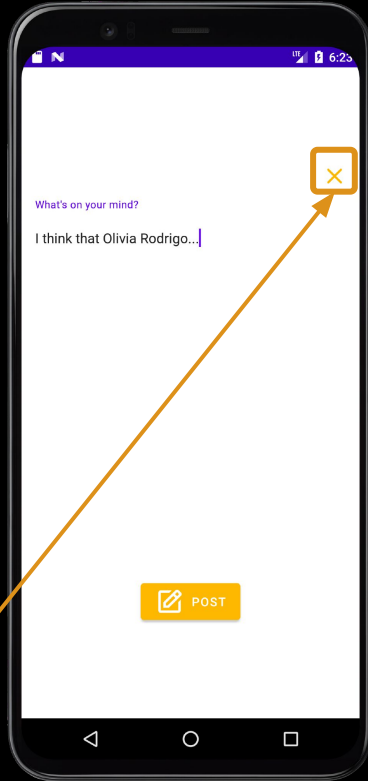

Discarding a Post

User Issue:

M.B. mentioned that there should be a way to discard posts

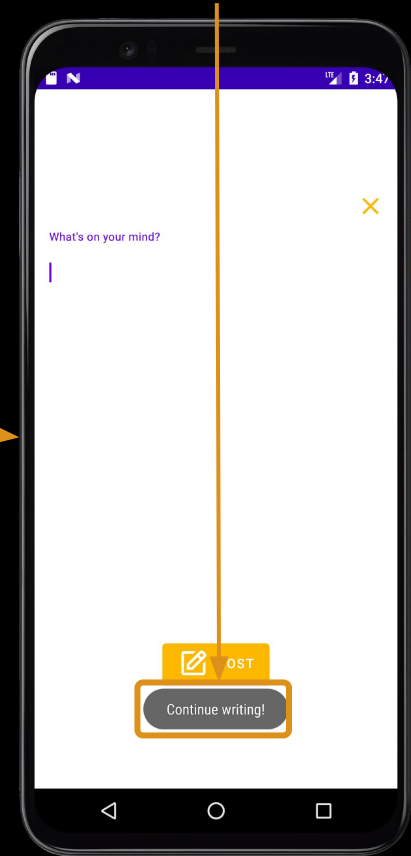

Change:

Upon opening the new screen, there is an "x" that the user can click to discard the post.

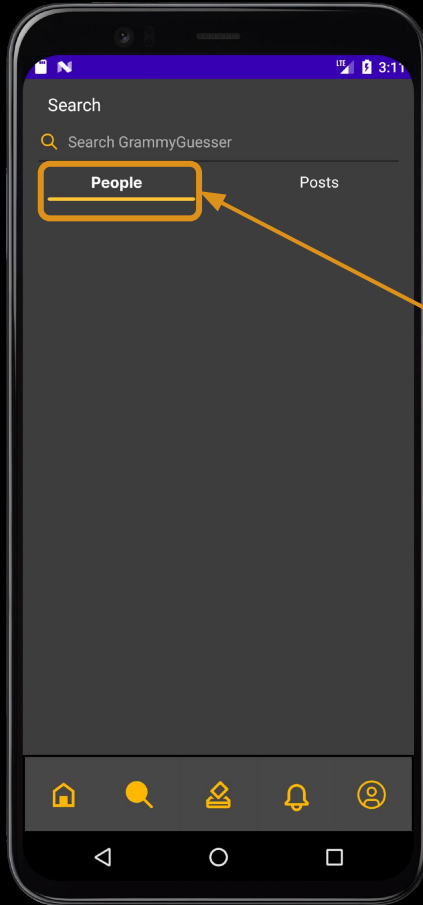

Change: Upon pressing "YES", the user is taken to the social feed, with the caption "Your post has been discarded"

Change: Upon pressing "NO", the user is taken back to the post, with the caption "Continue writing!"

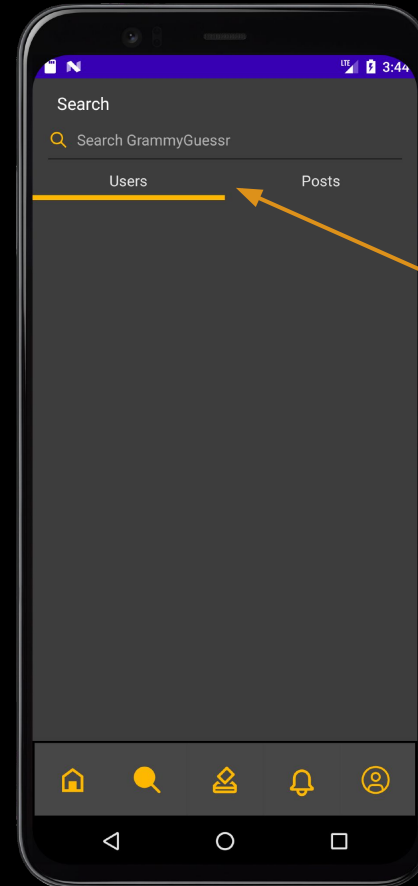

Changes to Search Page

User Issue:

M.B. and L.C. mentioned being confused at the search functionality. They both mentioned that “People” label on one of the tabs was ambiguous and a bit of a misnomer.

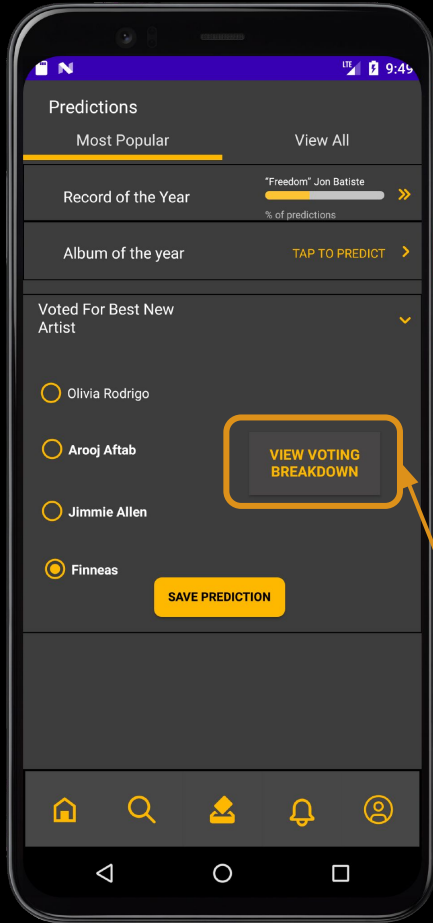

(Both thought “People” could refer to topics that were also people, like “Olivia Rodrigo”, instead our intention of “People” referring to only users.)

Change:

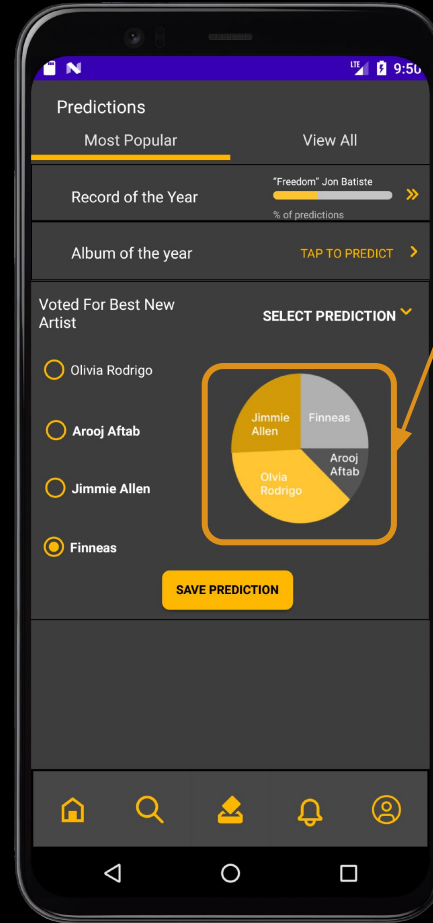

We fixed this simply by changing the “People” label to “Users”.

Changes to Predictions Page

User Issue: L.C. suggested that the user should not be able to immediately see how the public voted after the user casts a vote. Instead, L.C. suggested the user should be able to navigate to another screen that shows the overall breakdown of votes.

Change: We added an option to view the voting breakdown.

New Addition: L.C. also recommended using a pie chart to visualize the voting breakdown instead of the percentage (for more clarity).

Changes We Did Not Implement

- Looking back at our critical log, L.C. said that she would prefer the default tab to be the friend feed because that was the feed she cared about the most.

However, we chose not to make the default feed the friend feed. Similar to most popular social media apps, we thought having the global feed as the default page would encourage the user to explore the global feed and add new friends.

- L.C. mentioned she thought the ability to, when making a post, let the user tag a category that their post is associated with (e.g. if discussing Olivia Rodrigo's nomination for "Best New Artist" in a post, the user would tag the post with "Best New Artist" and "Olivia Rodrigo").

We all thought that this would be a good addition, but as searching was not one of our primary tasks and we had limited time, we decided to not implement this functionality.
